TITLE: Cryoscopic determination of aromatics in the hydrocarbon part of petroleum

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24 (II), 1962, 733, abstract 24M258 (Uzb. khim. zh., no. 2, 1962, 77 - 79)

TEXT: An adsorption variant of the quantitative cryoscopic determination of aromatic hydrocarbons is described, based on measuring temperature depression in the crystallization of cyclohexane solutions before and after these are chromatographed on coarse-pored silica gel. 0.5 g hydrocarbons are dissolved in 20 ml cyclohexane and the crystallization temperature of the solution is determined. The solution is then passed through a glass tube of 1 cm diameter and 40 cm high, filled with 40 g KCK (KSK) silica gel of the fraction 0.25 - 0.5 mm and dried preliminarily at 170°C. The amount of aromatic hydrocarbons, given in mole%, is then determined from the crystallization temperatures of the initial cyclohexane, the hydrocarbon solution in cyclohexane, and the filtrate. The error in determining the total content of aromatic hydrocarbons was < 2 %. The method can be Card 1/2

TITLE: Determination of the content of normal paraffin hydrocarbons in gasolines and kerosenes by the adsorption cryoscopic method

SOURCE: AN UzbSSR. Uzbekskiy khimicheskiy zhurnal, no. 4, 1963, 68-73

TOPIC TAGS: gasoline, kerosene, petroleum product, normal paraffins, quantitative determination, adsorption-cryoscopic method, cryoscopic method, cryoscopy, molecular sieve, freezing point, freezing point depression, freezing point depression method, cyclohexane, cyclohexane solution, chromatography, zeolite, CaA (5A), CaA (5A) zeolite, aromatics, silica gel, silica gel adsorbent, KSK, KSK silica gel adsorbent, isoparaffins, naphthene, aniline method, ideal Ca(A) zeolite

ABSTRACT: A rapid, simple, and accurate adsorption-cryoscopic (AC) method for quantitative determination of normal paraffins in

Card 1/1 ✓

L 17160-63
ACCESSION NR: AP3006873

light-colored petroleum products has been developed as the result of a study conducted with synthetic hydrocarbon mixtures. The normal-paraffin content (P) is calculated from $P = (t_4 - t_3) / (t_1 - t_3)$, where t_1 , t_3 , and t_4 are the freezing points of pure cyclohexane, of an aromatics-free 2-3% cyclohexane solution of the product under investigation, and of the same solution after chromatography through the CaA (5A) zeolite ignited at 500C for 6 hr, respectively. By employing a combination of the AC method proposed with an AC method for determination of aromaticity using chromatography through the KSK silica gel adsorbent (Ady*lova, T. T., Usmanova, D. A., and Ryabova, N. D. "Uzb. khim. Zh.," No. 2, 77, 1962), it is possible to determine consecutively aromatics and normal paraffins in a 0.5-ml sample; the total content of isoparaffins and naphthenes is determined from the difference. The use of the new method rather than the usual aniline method is recommended for determination of hydrocarbon composition by class. "Ideal" Sa(A) zeolites, i.e., those having 5Å pores without secondary structures, would make it possible to determine normal paraffins in gasolines and kerosenes without preliminary removal of aromatics. TITLE: Thermographic investigation of some synthetic zeolites

SOURCE: Uzbekskiy khimicheskii zhurnal, no. 6, 1964, 61-66

TOPIC TAGS: thermographic analysis, x ray analysis, zeolite/ Kurnakov pyrometer

ABSTRACT: This paper is concerned with thermal treatment, thermal stability, and dehydration of zeolites. A large series of zeolites were examined by being first held at constant weight in a desiccator over a 10% solution of H₂SO₄ for 24 hours. Thermal curves were obtained on a Kurnakov pyrometer (specimen weight of 0.6 g). Temperature was measured by a Pt-Pt/Rh thermocouple. All thermograms showed a large endothermic effect associated with dehydration. X-ray powder patterns were obtained of heated products, and changes in crystal structure were observed. The authors conclude that the first endothermic effect is determined by the amount of expelled water, and this amount characterizes the exchange capacity of the zeolite. The crystal structure of the zeolites changes at about 700C, which means that overheating the zeolites during regeneration may lead to loss of activity. Complete

2

dehydration of zeolites may be reached by heating to 500C. The most rapid elimination of water takes place in the interval 100-250C. Greatest capacity was observed in NaX (29%), CaX (29.2%), MgA (29.03%), and NiX (29.3%). The smallest capacity was found in CaA (19.1%). Orig. art. has: 4 figures and 2 tables.

TOPIC TAGS: zeolite, heptane, cryoscopic method, adsorption chromatography

SUB CODE: 07

ABSTRACT: The activities of four samples of CaA zeolites as determined by a cryoscopic method, presented by the authors in 1961, are compared with results as obtained by the volume of n-heptane adsorbed. Data show that the latter method, developed by the Groznig Scientific Research Petroleum Institute, gives activity values which are too low, being only 60-65% of those obtained by the cryoscopic method. Orig. art. has: 1 figure, 1 formula and 2 tables.

Abstract : At the Experimental Vegetable Station of the Timiryazev
Agricultural Academy in 1954-1956 diverse methods of pota-
to seed cultures were tried out: the direct sowing of the
seeds in the ground, the seedling method and the biennial
crop. As the initial material one used seeds coming from
the Smyslovskiy and Kameraz self-pollinating varieties
which are noted for their abundant formation of potato
apples. In order to increase the sprouting force and
seed germination a number of tests were run on hydrother-
mic treatment, stimulation and drenching of the seeds.

Abstract : Different methods have been applied to increase the germination and sprouting force of seeds: soaking and drying off at various temperatures, freezing the soaked seed for 24 hours at -3° , processing with chemical substances (soda, ethyl alcohol, hydroquinone). The Smyslovskiy variety was taken in the experiments. The most effective method proved to be soaking for a period of 6 hours and freezing, and among the chemical stimulants, hydroquinone (1 gram for every 1 liter of water.)

TITLE: On the separation of sulfur, selenium and tellurium

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 12, 1961, 23, abstract
120166 ("Tr. Mosk. khim.-tekhrol. in-ta im. D.I. Mendeleeva",
1961, no. 35, 111 - 115)

TEXT: Information is given on methods of separating S, Se and Te. To check the possibility of separating S and Se by rectification, the concentrate containing 70.5% Se (the rest S, low-volatile and non-volatile substances) was charged in a water-filled container and heated to 90°C for 1 - 2 hours. For further refining, the Se was placed in a crucible and heated during 1 hour at 200°C. Impurities emerging on the surface of the melt, were removed. Then Se was refined in a rectification column, and a product containing 99.99% Se was obtained. When separating Se and Te in the rectification column a product was obtained containing 99.997 - 99.999% Se. There are also chemical methods of separating Se and Te: a) a method based on the different volatility of SeO_2 and TeO_2 .

TITLE: Separation of sulphur, selenium and tellurium

SOURCE: Moscow. Khimiko-tekhnologicheskii institut. Trudy. no. 35, 1961. Khimiya i tekhnologiya neorganicheskikh veshchestv, 111-115

TEXT: The authors discuss this problem with special reference to the industrially important application of separating these elements when present in sulphuric acid sludge. Much of the article is based on published information on possible chemical and physical methods. Simple heating at rising temperatures fails to effect adequate separation, and other methods must be used. Chemical methods depend mainly on selective oxidation, and can be used easily for sulphur/selenium and sulphur/tellurium. For selenium/tellurium the problem is more difficult because of their close similarity and physical (distillation) methods are preferable. For the separation

TITLE: Composition and properties of production heats of AT-3 titanium alloys

SOURCE: AN SSSR. Institut metallurgii. Titan i yego splavy*, no. 10, 1963. Issledovaniya titanovykh splavov, 218-223

TOPIC TAGS: AT-3 titanium alloy, titanium alloy, AT-3 alloy structure, AT-3 alloy property, forged AT-3 titanium alloy, cast AT-3 alloy, extruded AT-3 alloy, AT-3 alloy heat resistance, complex titanium alloy, titanium aluminum alloy

ABSTRACT: Mechanical properties and cross-sectional macro- and microstructure have been investigated in cast, forged, and extruded specimens of high-quality AT-3 alloy containing Al, Cr, Fe, and Si. The macrostructure of the AT-3 alloy showed a fine, uniform grain size under all test conditions. With increases in temperature of the forging and extrusion processes, the structure was affected only slightly. The mechanical properties of the tested alloy were uniform and stable, although in rods with diameters of 160, 100, and 65 mm some anisotropy was found. This anisotropy can be explained by the occurrence of some inclusions.

Card 1/2

ACCESSION NR: AT4007044

distributed along the direction of deformation of the metal. These inclusions in longitudinal specimens did not affect the mechanical properties of the alloy but markedly decreased the metal strength in the cross sections. The microstructure of the AT-3 alloy was an α -solution under all tested conditions. The AT-3 alloy is thermally stable in the interval 400-450 C, does not become brittle after 100 hours of exposure, and shows high and long-lasting heat resistance. "V. S. Mikheyev and S. Ye. Ivanova also took part in the work." Orig. art. has: 6 figures.

TITLE: Dependence of the tensile properties and heat-resistance of ST1 titanium alloy on heat treatment

SOURCE: Soveshchaniye po metallokhimii, metallovedeniyu i primeneniyu titani i yego splavov, 6th. Novyye issledovaniya titanovykh splavov (New research on titanium alloys); trudy soveshchaniya. Moscow, Izd-vo Nauka, 1965, 251-257

TOPIC TAGS: titanium alloy, aluminum containing alloy, tin containing alloy, alloy heat treatment, alloy property /ST1 alloy

ABSTRACT: Two heats of ST1 titanium alloy (Ti-Al-Sn system) with contents of alloying elements at the upper (ST1V) and lower (ST1N) limits were tested to determine the effect of heat-treatment conditions on tensile and heat-resistance characteristics. Specimens cut from forged alloy bars were annealed at 650-1200C and air cooled or water quenched. The critical temperature of $\alpha \rightarrow \alpha + \beta$ transformation was found to be 1000-1030C; the structure of specimens annealed at 700-950C consisted only of α -phase. Both types of alloy have a two-phase $\alpha + \beta$ structure after annealing at 1000-1050C. The best combination of properties in ST1N alloy was achieved by annealing at 800C followed by air cooling and in ST1V alloy, by annealing at 1000C followed

2.

by water quenching. Tested at 700C after treatment under these conditions, the alloys tensile strength was 43—50 kg/mm² for ST1N alloy and 53—70 kg/mm² for ST1V alloy. The respective 100-hr rupture strength of ST1N and ST1V alloys at 600C was 25.5 and 28.0 kg/mm² and at 700C, 6.0 and 8 kg/mm². ST1V alloy, water quenched from 1050C and tested at 800C under a stress of 20 kg/mm², had a rupture life of 6—7 hr. The lowest creep rate at 750C in ST1N alloy was achieved by annealing at 1050—1150C followed by air or water cooling. Orig. art. has: 5 figures and 2 tables. [AZ]

TITLE: The Kinetics of the Acid-Catalytic Decarbonylation of Benzoyl Formic Acid (Kinetika kislotno-kataliticheskogo dekarbonilirovaniya benzoilmurav'inoj kisloty)

PERIODICAL: Doklady AN SSSR, 1957, Vol. 117, Nr 6, pp. 1017 - 1020 (USSR)

ABSTRACT: The present paper investigates the determination of particles participating in the elementary act of the acid processes and compares the constant of speed with the concentration of the particles. The reactions $C_6H_5COCOOH \rightarrow CO + C_6H_5COOH$ were selected as model. The solutions of benzoyl formic acid in water and in diluted solutions of sulphuric acid do not absorb in the visible range of the spectrum. On dissolution of $C_6H_5COCOOH$ in concentrated H_2SO_4 (80 - 90 %) an absorption in the visible range of the spectrum appears. The absorption coefficient of benzoyl formic acid considerably increases with increasing concentration of H_2SO_4 . In the present work the speed of the decarbonylation of solutions of $C_6H_5COCOOH$ in H_2SO_4 was determined from the speed of the decrease in the optical density of the solution when $\lambda = 400 \text{ m}\mu$. The optical density was measured by the spectrometer ($\Phi - 4$) in quartz cuvettes. A diagram illustrates a typical kinetic curve of the decarbonylation

Card 1/3

20-6-27/47

The Kinetics of the Acid-Catalytic Decarboxylation of Benzoyl Formic Acid

process (the dependence of the optical density D of the solution on the time t) and its logarithmic anamorphosis. The influence of the acidity h_0 upon the constant K of the speed was investigated in the range of concentrations of from 85,46 to 99,94 % of H_2SO_4 at $T = 15^\circ C$. The corresponding results are illustrated by a diagram. In the range from $h_0 = 10^{8,06}$ to $h_0 = 10^{9,4}$ the dependence between $\lg K$ and the acidity function H_0 is linear: $\lg K + 1,8 H_0 = \text{const}$. At higher values of acidity a deviation from the linearity was observed. The temperature dependence of K for the solutions of $C_6H_5COCOOH$ in 98,80; 96,2; 92,89,77 and 85,46 % H_2SO_4 were determined in a narrow range of temperature. These data are in agreement with the Arrhenius (Arrhenius) equation. Benzoyl formic acid is supposed to exist in different forms in the concentrated and diluted solutions of H_2SO_4 . In diluted H_2SO_4 it is supposed to exist in a nonionized state, but with increasing acidity of the medium it is ionized. Then the authors report on the determination of the constant of alkalinity. There are 4 figures, 1 table, and 1 non-Slavic reference.

TITLE: Kinetics and Mechanism of Reactions in Concentrated Strong Acid Media. I. Kinetics of Dehydration of o-Benzoyl Benzoic Acid in Concentrated Solutions of Sulphuric Acid

PERIODICAL: Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 9, pp 1992-2001 (USSR)

ABSTRACT: An investigation was made of the kinetics of catalytic dehydration of o-benzoyl benzoic acid (I) to anthraquinone in sulphuric acid (79.92% to 100%) at temperatures of from 50° to 97.5°C. The spectrophotometrical method (spectrophotometer type SF-4) was applied and the dependence of the dehydration rate constant on the acidity of the medium and on temperature was determined (Table 1). Three forms of (I) were found to occur in the state of equilibrium in the case of (I) being ionized in highly acid medium - a non-ionized form BOH, a protonized form BOH₂⁺, and a dehydrated protonized form B⁺. The ratio between the concentrations of the three forms is determined by the acidity of the medium and the activity of water. The limiting stage of the process is the isomerization of the dehydrated

Card 1/3

SOV/76-33-9-17/37

Kinetics and Mechanism of Reactions in Concentrated Strong Acid Media.
 I. Kinetics of Dehydration of *o*-Benzoyl Benzoic Acid in Concentrated Solutions of Sulphuric Acid

form B⁺. A specification is given of the values of the actual rate constants at 25°C, as obtained by extrapolation (according to the Arrhenius Law), further, the concentration of the three forms of (I) at various sulphuric acid concentrations (Table 2), as well as the dependence of the ionization constant on acidity (Table 3). By spectrometric and kinetic methods the following values were obtained:

$$K_1 = \frac{a_{H^+} a_{BOH}}{a_{BOH_2^+}} = 4 \cdot 10^8; \quad K_2 = \frac{a_{H^+} a_{BOH_2^+}}{a_{B^+} a_{H_3O^+}} = 1 \cdot 10^9$$

Values were obtained for the true activation energy $E_w = 24.5$ kcal/mol (characteristic of the energy balance of the elementary act of the isomerization of dehydrated (I)-ion to anthraquinone), the sum of the ionization heats $Q_1 + Q_2 = 6.5$ kcal/mol, and the value of the true preexponential factor $A = 7 \cdot 10^{11}$ sec⁻¹. There are 7 figures, 3 tables, and

TITLE: Study of metal-hydroxyl bond energies in CaOH, SrOH, and BaOH molecules

SOURCE: Teplofizika vysokikh temperatur, v. 3, no. 2, 1965, 318-321.

TOPIC TAGS: combustion, hydrogen oxygen, metallized fuel, metal combustion, flame spectroscopy

ABSTRACT: The energies of the hydroxyl-metal bonds in CaOH, SrOH, and BaOH, which may be present together with the oxides in hydrogen-air flames, were determined spectroscopically by studying the reaction of Ca, Sr, and Ba with combustion products of hydrogen-air flames having different compositions. The metals were introduced as SrCl₂, BaCl₂ and Ca(COO)₂ solutions into the flame of a Meker burner. The partial pressures of the metals were determined from the spectral line intensities measured at flame temperatures of 1760—2160K. The experiments yielded bond energies of about 101, 97, and 112 kcal/mol for Ca, Sr, and Ba, respectively. These values indicate, as was shown by thermodynamic calculations, that a considerable amount of the metals must be present in rich hydrogen-air flames as Me-OH, formed by the reaction $Me + H_2O = MeOH + H$. The bond energies of MeO were

TITLE: Investigation of spectra and determination of dissociation energies of oxygen compounds of gallium and indium

SOURCE: Optika i spektroskopiya, vo. 18, no. 1, 1965, 132-134

TOPIC TAGS: arc spectrum, dissociation energy, gallium compound, indium compound, oxide, hydroxide

ABSTRACT: In view of the contradictory published data concerning the dissociation energy of the GaO and InO molecules, and also concerning the oxygen compounds produced by gallium and indium in flames, the authors have undertaken new investigations of the electronic spectrum of GaO and the equilibrium reaction of Ga and In with the combustion products of flames of the type $aH_2 + bO_2 + cN_2 + dH_2O$ and $aCO + bO_2 + dH_2O$. The known system of bands of GaO was investigated in the 3350--4150 Å band with a grating spectrograph, and the constants of the molecule Ga⁹⁰O were determined. An attempt to obtain the absorption spectrum of GaO in the range 3600--7000 Å with the arc and gas discharge exposed to a strong pulsed
